### Evaluating cognitive effects in healthy volunteers

- Alzheimer's Disease (AD)
- Mild Cognitive Impairment due to AD
- Attention Deficit Hyperactivity Disorder (ADHD)
- Depression
- Schizophrenia
- Neuromuscular Disease
- Multiple Sclerosis
- Epilepsy
- Stroke and Cerebrovascular disease (CVA)
- Parkinson's Disease
- Traumatic Brain Injury
- Autism
- Huntington's Disease
- Down's Syndrome (adults)
- Obsessive Compulsive Disorder (OCD)

*If repeat testing is required we recommend the Attention Switching Task (AST)*

**www.cantab.com**
The Cognitive Research Test Selector provides an overview of our recommended Cantab test panels for different research applications, and is designed to enable you to select the most appropriate cognitive tests. Cantab is the world’s most validated and comprehensive computerised cognitive assessment system. The language-independent, sensitive touchscreen tests have been helping researchers to collect high-quality data for 30 years.
